

How do I PAT test Christmas tree lights?

As Christmas lights are not generally used all year round, it's very important to store them safely to avoid damage. Most lights will be Class 2, and can be treated as a standard Class 2 item, paying attention not to subject them to a 500V insulation test if they don't conform to EN60950. Check carefully for signs of over-heating, and split or chewed cables.
